Project Issues

If I find a bug what do I do?

[Email](#) me, or go [here](#) and see if I already know about it.

Software Issues

Use The Client Side Only Functionality.

- make the [dictionary.dic](#) available on your server.
 - set the attribute *dictionary* to the location of the [dictionary.dic](#) file on the spellcheck:TextArea or spellcheck:RichTextEditor
-

How do I modify the word break?

the file `com.flexendibles.spellcheck.engine.Constants.wordBreak` is the regex that is used to break the words up. You can modify it. I've tried to make ' alpha's and special foreign characters all part of things that are

Everything is Being underlined....HELP!?!

Most likely the issue lies with either a Fault error occurring on the dictionary file http get or an issue with an empty word list being downloaded.

If you believe that the word list should be downloadable than make sure you can reach it on your browser first and then empty your local cache by right clicking in the flash player and selecting **Settings...** and then putting local storage to 0 and then finally refreshing your page.

If this does not work please [let me know about it.](#)

Also I fixed a bug where the fault code's for an HTTP Service get wasn't being pushed out, now you should see if there is an issue loading the file.

How is this software licensed

LGPL, I changed it to LGPL when joining sourceforge.net. I figure if you can make some money off of it you should, I'm just doing this for fun.
